2024 Highlights

Improve Your Planting & Soil Health

Adding fresh organic matter and caring for your soil with the practices below will improve both your soil and plant health year after year.

Compost: Look for quality sources and ask questions about the product, or better yet, compost at home and utilize it in the garden.

Mulch: Leaves, straw, grass clippings, compost and woodchips may all be used. Remember to keep mulch away from plant stems. The best mulch is recycled from your yard!

Water, water, water: To help plants root at the start, keep soil moist with consistent watering while they establish in their new home.

Sunlight: Most of our species prefer full sun but many will grow very well in partial sun, ideally 3 to 6 hours of sun a day. See plant info on page 2.

Attract the Karner Blue

Ever consider establishing a wildflower plot on your property? Whether it's a small or big area of native wildflowers, here are some simple reasons to try it:

- * Less time mowing
- * Reduce fertilizer and herbicide use on your lawn
- * Improve soil nutrients & health
- * Promote beneficial pollinators
- * Create wildlife habitat for birds and more!
- * Promote biodiversity
- * More colors to admire in your yard!

Check out the Northeast Wildflower Seed Pack today!

Forest Pest Alert!

The Hemlock Woolly Adelgid (HWA) is a small insect that has been killing Eastern Hemlocks in the U.S. for a number of years; you may have heard about their recent discovery and subsequent management in the Lake George Watershed. As a way to monitor the spread in our communities, we are offering HWA Monitoring Kits, as well as five free Red Spruce seedlings to landowners. The HWA Monitoring Program is for landowners to plant an alternate, native species and to help monitor the health of existing hemlocks on their property. With your kit, you'll learn about the identification of HWA, and signs and symptoms to look for! This program is on a first come, first serve basis.

To reserve your trees, sign up by visiting our website here:

Feeling Fruitless?

Are you having trouble with your fruit trees not bearing? Do you want to make sure that your young trees grow into productive, mature trees?

Try Trimming!

Some benefits to proper tree pruning:

- * Increased air flow allows for less fungal growth and better pollination.
- * Controlled tree growth for easy harvest.
- * More concentrated growth on fruits rather than woody growth.

For more information, take a look at our pruning guide at our website:
